Bowling Fingerprint (percentile vs ODI peers)

Changing (last 3 years vs career): bounce down; turn up.

Solid line = career, **dotted** = last 3 years. Percentile within same-type ODI peers (grey = the peer distribution, line = this bowler). Release/crease vs hand × pace/spin; movement/speed/repeatability vs pace/spin. **Crease variation** = how much they shift their release point sideways across the crease ball to ball (high = varies a lot, low = same spot every ball). **Repeatability** = length consistency over their stock-length band, so deliberate yorkers/bouncers don't count as poor control (high = tighter, more metronomic than peers). A marker at the very edge = beyond the typical peer range on that trait.

Phase Profile (where they bowl & how they go there) ► wickets

Aiden bowls most in the **middle** (81% of their overs) and goes at **5.35** at the death vs 5.23 in the powerplay.

Phase	% of overs	Overs	Economy	Wkts	Average	SR	Boundary %	Dot %
Powerplay	11%	23.5	5.23 P17	2 P21	61.5	70.5	11%	53%
Middle	81%	170.0	6.01 P11	13 P20	78.6	78.5	9%	42%
Death	7%	15.3	5.35 P87	4 P61	20.5	23.0	10%	57%

Blue **P##** = percentile vs modern-era ODI spin peers in that phase (two-new-balls era, 2011+; economy inverted so **higher** = **harder to score off**, wickets = strike threat; grey = bottom third). So a high death-economy percentile means cheap for the death, where everyone leaks.

Match-ups (each hand, split over vs round the wicket)

Round % = share of their balls to that hand bowled from round the wicket. Sub-rows split each hand over vs round (shown when ≥30 balls).
